

Script for Vyuha (~4:00 or less)

[0:00–0:10] — **No speaker.** Visual: black screen. Audio: Tony Stark clip — *"We create our own demons."* Text overlay fades in under it: **VYUHA.**

[0:12–0:32] — **Team Introduction.** (Trombokendu)

"And that's why The Syndicates present you "Vyuha: Edge-AI Behavioral Defense SDK for Real-Time Coercion Interception and Mule Ring Neutralization". Now too many buzz words over here.

So let's get to know what it is basically and above all why is it?"

[[Black Screen: Text: "The Problem Statement"]]

[0:32–1:25] — **Problem Statement.** {Slide and front camera overlay} {Slide 3} (Sneha)

"India logged 28.15 lakh cyber-fraud cases last year. The fastest-growing and cruelest is the 'digital arrest', fraudsters pose as police on video calls, isolate victims for hours, and coerce them into paying with their own hands, their own correct PIN. It hits anyone, retirees, students, professionals, because the fraud isn't in the transaction. It's in the hours before it. And no bank app is watching those hours."

Then Explain Points in Slide 3 in short but address all points...

[[Black Screen: Text: "Our Approach"]]

[1:25–2:05] — **Approached Solution.** {Slide and front camera overlay} {Slide 4} (Alaukik)

"Vyuha is an Edge-AI behavioral shield built into where this money actually moves, UPI and banking apps, not e-commerce checkouts. It rides the same real-time channel banks already use for RBI's Financial Fraud Risk Indicator, and adds what that system can't see: your own behavioral state, right now. On-device, Vyuha notices the pattern, a long, active call, a suddenly opened UPI screen, and steps in before the PIN. It doesn't block you. It asks: 'Is someone on this call directing this payment?' Only if the answer says yes, or there's no answer at all, does it bring a trusted contact in, breaking the isolation the scam depends on."

Then Explain Points in Slide 4 in short but address all points...

[[Black Screen: Text: "How do we do that?"]]

[2:05–3:00] — **Technical Overview.** {Slide and front camera overlay} {Slide 5, 6} (Trombokendu)

"Underneath, it's a stateful OODA loop orchestrated with LangGraph. A lightweight on-device router triages telemetry and clears roughly 95% of normal activity instantly. Flagged sessions go to a Spatio-Temporal Graph Neural Network, built on PyTorch Geometric, checking the receiving account against known mule-ring patterns — the same graph-based approach behind RBI's own MuleHunter.AI. A

contextual bandit then picks the lightest friction that actually breaks the trance, and learns from every real response."

Then Explain Points in Slide 5, 6 in short but address all points...

[[Black Screen: Text: "Impact & Profit"]]

[3:00–3:35] — **Impact & Benefits & Business Model.** {Slide and front camera overlay} {Slide 7, 8} (Aditya)

"For banks and UPI providers, Vyuha cuts chargeback losses by catching fraud before settlement, not after. For everyday Indians, especially senior citizens, the most targeted group, it's a bodyguard that never sleeps, invisible until the one moment it's needed, without slowing down a single genuine payment."

Then Explain Points in Slide 7, 8 in short but address all points...

[[Black Screen: Text: "Closing"]]

[3:35–3:55] — **Close.** {Black Screen. Only Audio} (Trombokendu)

We make this entire system strictly scrutinised and far away from a simple "Scam Detector". Because "*Prevention is better than cure*" also because

Audio: Tony Stark clip — "*A famous person once said. We create our own demons*"
